**DECLARATION OF THE INTERNET  
ENGINEERING TASK FORCE, AN  
ORGANIZED ACTIVITY OF THE  
INTERNET SOCIETY**

---

18                  I, Alexa Morris, based on my personal knowledge and information, hereby declare as follows:

- 19                 1. I am Executive Director of the Internet Engineering Task Force (“IETF”) and have held  
this position since January 1, 2008.
- 20                 2. Among my responsibilities as Executive Director, I act as the custodian of Internet-  
Drafts for the IETF.
- 21                 22                 3. I make this declaration based on my personal knowledge and information contained in  
the business records of the IETF, or confirmation with other responsible IETF personnel  
with such knowledge.

- 1           4. It is the regular practice of the IETF to publish Internet-Drafts and make them available  
2           to the public on its website at [www.ietf.org](http://www.ietf.org). The IETF maintains copies of Internet-  
3           Drafts in the ordinary course of its regularly conducted activities.
- 4           5. Attachment A hereto lists three Internet-Drafts, true and correct copies of which are  
5           included as Exhibit 1-3.
- 6           7. I personally reviewed the documents included as Exhibit 1-3.
- 7           8. I hereby certify, in accordance with the requirements of Federal Rule of Evidence 902,  
9           that Exhibit 1-3 attached therein constitute a record of regularly conducted business  
10          activity which was (A) made at or near the time of the occurrence of the matters set forth  
11          by, or from information transmitted by, a person with knowledge of those matters; (B)  
12          kept in the course of the regularly conducted activity; and (C) made by the regularly  
13          conducted activity as a regular practice.
- 14          15. Based on a search of IETF records, I have determined that the IETF maintained copies  
16          of Exhibit 1-3 in the ordinary course of its regularly conducted activities.
- 17          18. Based on a search of IETF records and the IETF's course of conduct in publishing  
18          Internet-Drafts, I have also determined that Exhibit 1-3 were published on the IETF  
19          website ([www.ietf.org](http://www.ietf.org)) on or about the dates referenced in Attachment A. At such  
20          times, these documents were reasonably accessible to the public, and were disseminated  
21          or otherwise available to the extent that persons interested and ordinarily skilled in the  
22          subject matter or art exercising reasonable diligence could have located them by  
23          searching the IETF website for the filenames of the documents.
- 24          25. Based on a search of IETF records, I hereby certify that the document listed in  
26          Attachment B is not contained in IETF records and cannot be authenticated by me.
- 27
- 28

1  
2 Pursuant to Section 1746 of Title 28 of United States Code, I declare under penalty of  
3 perjury under the laws of the United States of America that the foregoing is true and correct and  
4 that the foregoing is based upon personal knowledge and information and is believed to be true.

Session Initiation Protocol Service Examples  
draft-ietf-sipping-service-examples-15

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with Section 6 of BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at  
<http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at  
<http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 12, 2009.

## Abstract

This document gives examples of Session Initiation Protocol (SIP) services. This covers most features offered in so-called IP Centrex offerings from local exchange carriers and PBX (Private Branch Exchange) features. Most of the services shown in this document are implemented in the SIP User Agents, although some require the assistance of a SIP Proxy. Some require some extensions to SIP

Johnston, et al.                  Expires January 12, 2009                  [Page 1]

Internet-Draft                  SIP Service Examples                  July  
2008

including the REFER, SUBSCRIBE, and NOTIFY methods and the Replaces and Join header fields. These features are not intended to be an exhaustive set, but rather show implementations of common features likely to be implemented on SIP IP telephones in a business environment.

SIP Service Examples

July

## 1. Overview

This document provides example call flows detailing a SIP implementation of the following traditional telephony services:

Call Hold	Music on Hold
Unattended Transfer	Consultation Hold
Unconditional Call Forwarding	Attended Transfer
No Answer Call Forwarding	Busy Call Forwarding
3-way Call	Incoming Call Screening
Find-Me	Call Pickup
Call Park	Outgoing Call Screening
Automatic Redial	Click to Dial

Note that the Single Line Extension call flow has been removed from this document and will be covered in a separate document.

The call flows shown in this document were developed in the design of a SIP IP communications network. They represent an example set of so-called IP Centrex services or PBX services.

It is the hope of the authors that this document will be useful for SIP implementers, designers, and protocol researchers alike and will help further the goal of a standard implementation of RFC 3261 [RFC3261] and some of its extensions.

These flows represent carefully checked and working group reviewed scenarios of SIP service examples as a companion to the specifications.

These call flows are based on the current version 2.0 of SIP in RFC 3261 [RFC3261] with SDP usage described in RFC 3264 [RFC3264]. Other RFCs also form part of the SIP standard and are used and referenced in these call flows.

The SIP specification and the other referenced documents are definitive as far as protocol issues are concerned. Also, these flows do not represent the only way to implement these services – other approaches such as 3pcc (Third Party Call Control) [RFC3725] or Back-to-Back User Agents (B2BUA) can be used. This specification does not preclude these or other approaches for implementing such services. The peer-to-peer design and principles of these service examples are described in the Multiparty Framework document [I-D.ietf-sipping-cc-framework].

These flows assume the functionality described in the SIP Call Flow Examples document [RFC3665], which explores basic SIP behavior.

Some of the scenarios described herein make use of the SIP method

Johnston, et al. Expires January 12, 2009 [Page 3]

Internet-Draft SIP Service Examples July  
2008

extension REFER [RFC3515] and the SIP header extension Replaces [RFC3891], and the SIP header extension Join [RFC3911]. The SIP Events document [RFC3265] describes the use of SUBSCRIBE and NOTIFY while the SIP Dialog Event Package [RFC4235] document describes the dialog event package. Some examples make use of the GRUU (Globally Routable User Agent URI) [I-D.ietf-sip-gruu] extension.

These flows were prepared assuming a network of proxies, registrars, and other SIP servers. The use of Secure SIP URIs (sips) is shown throughout this document, implying TLS transport on each hop with assumed certificate validation. However, other security approaches can be used. The use of Digest authentication is shown in some examples.

The emphasis in these call flows is the SIP signaling exchange. As a result, only very simple SDP offer/answer exchanges are shown with audio media. These flows apply equally well for other media and multi-media sessions. For more advanced examples of SDP offer/answer exchanges, refer to [RFC4317].

Each call flow is presented with a textual description of the

scenario, a message flow diagram showing the messages exchanged between separate network elements, and the detailed contents of each message shown in the diagram.

### 1.1 Legend for Message Flows

Dashed lines (---) represent control messages that are mandatory to the call scenario. These control messages can be SIP signaling.

Double dashed lines (==) represent media paths between network elements.

Messages with parenthesis around name represent optional control messages.

Messages are identified in the Figures as F1, F2, etc. This references the message details in the table that follows the Figure.

Lines longer than 72 characters are handled using the <allOneLine> convention defined in Section 2.1 of RFC 4475 [RFC4475].

Comments in the message details are shown in the following form:

```
/* Comments. */
```

SIP Service Examples

July

Alice

Proxy

Bob

In this scenario, Alice calls Bob, then Bob places the call on hold.

Internet-Draft  
2008

SIP Service Examples

July

Bob then takes the call off hold, then Alice hangs up the call.

Note

that hold is unidirectional in nature. However, a UA that places the

other party on hold will generally also stop sending media, resulting

in no media exchange between the UAs. Older UAs may set the connection address to `0.0.0.0` when initiating hold. However, this behavior has been deprecated in favor of using the `a=sendonly` SDP attribute.

Also note the use of the rendering feature tag defined in RFC 4235 [RFC4235] used in F10 and F11 to indicate in that Bob's UA is no longer rendering media to Bob, i.e. that Bob has placed the call on hold.

SIP Service Examples

July

In this scenario, Alice calls Bob. Bob places call on hold. Bob calls Carol. Bob then disconnects with Carol, then takes the call

with Alice off hold. The call ends when Alice hangs up.

Also note the use of the rendering feature tag defined in RFC 4235 [RFC4235] used in F10 to indicate in that Bob's UA is no longer rendering media to Bob, i.e. that Bob has placed the call on hold.

### 2.3. Music On Hold

Alice                    Bob                    Music Server

SIP Service Examples

July

In this flow, Bob places Alice on hold with music. This is performed by Bob sending a REFER to a Music Server which sends an INVITE with Replaces to Alice. The Music Server then sends RTP music to Alice. Bob picks the call up from hold by sending an INVITE with Replaces to Alice.

Note the use of the rendering feature tag defined in RFC 4235 [RFC4235] used in F5 to indicate in that Bob's UA is no longer rendering media to Bob, i.e. that Bob has placed the call on hold. Feature tags are also used in F12 with the automaton (defined in RFC 3840 [RFC3840]) and byeless feature tags (defined in RFC 4235 [RFC4235]) to describe the capabilities of the Music Server.

Should Alice not wish to receive music on hold, her UA could refuse F12 and she will remain on hold with Bob, but in silence.

/\* Normal media session between Alice and Bob is resumed \*/

## 2.4. Transfer – Unattended

In this scenario, Bob calls Alice. Alice then transfers Bob to Carol, then Alice disconnects with Bob. Bob establishes the session to Carol then reports the success back to Alice in the NOTIFY in F15.

Internet-Draft  
2008

SIP Service Examples

July

If the transfer fails, Bob can send a new INVITE back to Alice to re-establish the session.

Despite the BYE sent by Alice in F9, the dialog between Alice and Bob

still exists until the subscription created by the REFER has terminated (either due to a NOTIFY containing a Subscription-State: terminated;reason=noresource header field, as in F15, or a 481 response to a NOTIFY).

For more about call transfer see the transfer [I-D.ietf-sipping-cc-transfer] document.

## 2.5. Transfer – Attended

Johnston, et al.  
56]

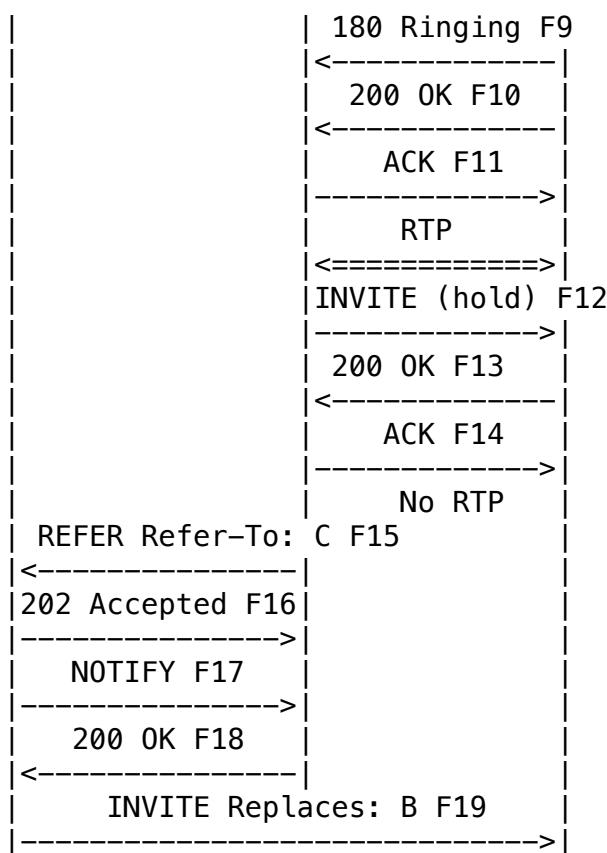

Expires January 12, 2009

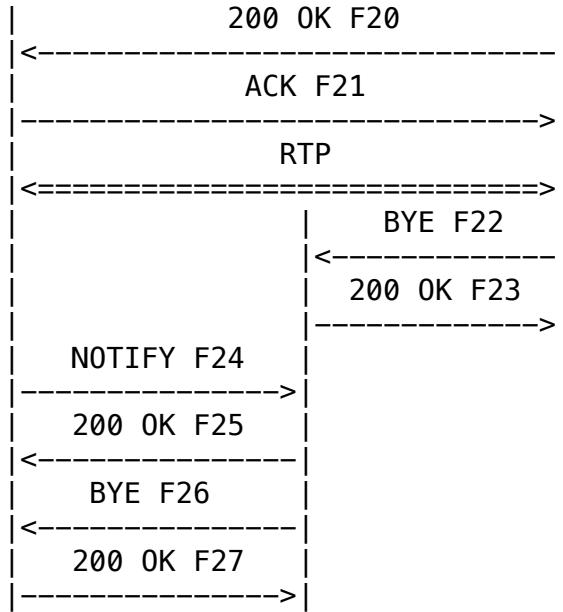

[Page

Internet-Draft  
2008

SIP Service Examples

July

In this scenario, Alice calls Bob. Bob puts Alice on hold then calls

Carol to announce transfer, then places Carol on hold. Bob transfers

Alice to Carol which replaces the session between Bob and Carol.

Johnston, et al.  
57]

Expires January 12, 2009

[Page

Internet-Draft  
2008

SIP Service Examples

July

Carol then disconnects session with Bob. Alice reports success of transfer to Bob, who then disconnects with Alice. In this example, the Replaces header field [RFC3891] is inserted into the Refer-To URI

by Bob. Note that the Refer-To URI is the Contact URI returned by Carol in the 200 OK response F10. This ensures that only the correct

instance of Carol is reached. The presence of the gr URI parameter in the Contact URI in message F10 indicates that the Contact URI is a

GRUU [I-D.ietf-sip-gruu] and will be globally routable outside of the dialog.

Without knowing the Contact URI is a gruu, Bob must be prepared, if the triggered INVITE had failed, to retry the REFER

with  
a Refer-To URI of the URI used to reach Carol but with a Require:  
replaces header escaped in the Refer-To header field, as discussed  
in  
the transfer [I-D.ietf-sipping-cc-transfer] document.

## 2.6. Transfer – Instant Messaging

In this scenario, Alice and Bob establish a session between them. Bob wants Carol to take the call so sends an Instant Message (IM) to Carol containing Alice's URI and an embedded Replaces header field. If Carol clicks on the URI, Carol's SIP UA sends an INVITE to Alice which replaces the session with Bob.

This scenario shows the use of the SIP MESSAGE [RFC3428] method to pass the URI. However, another IM protocol or other method could have been used to pass the URI from Bob to Carol.

## 2.7. Call Forwarding Unconditional

Bob wants all calls forwarded to the PSTN (which is just another URI to the proxy server). Alice calls Bob. The proxy server rewrites the Request URI, and forwards the INVITE to a Gateway. Details of messaging behind the Gateway are not shown.

Note that the 181 Call is Being Forwarded response does not have a To tag added as the proxy does not wish to establish an early dialog with Alice. Strictly speaking, the proxy is behaving as a User Agent in this case as a proxy can not generate non-100 provisional

responses.

Note also that forwarding could be accomplished using a redirect (302 Moved Temporarily response).

#### Message Details

## 2.8. Call Forwarding – Busy

Bob wants calls to B1 forwarded to B2 if B1 is busy (this information is known to the proxy). Alice calls B1, B1 is busy, the proxy server

## 2.9. Call Forwarding – No Answer

Bob wants calls to B1 forwarded to B2 if B1 is not answered (information is known to the proxy server). Alice calls B1 and no one answers. The proxy server then places the call to B2.

SIP Service Examples

July

## 2.10. 3-way Conference – Third Party is Added

In this scenario, Alice and Bob are in a 2-party call (session) when

Bob wishes to add Carol into the conversation. Bob is capable of media mixing in a 3-party call. Bob first sends a re-INVITE to Alice

changing Contact URIs to one that indicates Bob's mixer and acts like

a focus. As a result, Bob includes the "isfocus" feature tag [RFC3840] as described in [RFC4579]. Bob then INVITEs Carol using the same Contact URI. Note that Bob could wait to re-INVITE Alice until after Carol has answered. Bob could also put Alice on hold before calling Carol

## 2.11. 3-way Conference – Third Party Joins

In this scenario, Alice and Bob are in a 2 party call and Carol wishes to join resulting in a three party call. Carol could have learned Bob's dialog identifier using some non-SIP means, or possibly from a NOTIFY with the dialog package sent by Bob. Carol sends an INVITE to Bob containing a Join header identifying the dialog between Alice and Bob. Bob re-INVITEs Alice to switch to focus mode and includes the "isfocus" feature tag [RFC3840] as described in [RFC4579]. Bob then accepts the INVITE from Carol, resulting in the 3-way call.

2008

SIP Service Examples

July

Alice's call to Bob will result in an attempt to locate that user by calling locations from a list of contacts. The location to answer the call becomes the active set, no other sets may join the call.

While this flow shows a sequential search, the search could be accomplished using parallel forking, as in the previous example.

## 2.13. Call Management (Incoming Call Screening)

Bob has an incoming call screening list, Alice is included on the list of addresses Bob will not accept calls from. Alice attempts to call Bob. Messages F1, F2, and F3 are included to show that Bob does not accept INVITEs that have not been screened by the proxy.

Note that call screening can not be done using the From header – instead some form of authentication credentials must be used.

The screening proxy inserts an announcement URI in an Error-Info header field which Alice accesses by sending an INVITE to listen to the Announcement. The Announcement Server uses the automaton and rendering feature tags in F12 and F13 to indicate that it is a

```
media
server only capability of playing announcements.
```

## 2.14. Call Management (Outgoing Call Screening)

Alice has an outgoing call screening list, Bob is included on the list of addresses Alice will not be able to place a call to. Alice attempts to call Bob.

Alice could establish a session to listen to the announcement in the Error-Info header field.

[Page

Internet-Draft  
2008

SIP Service Examples

July

In this example, Alice calls Bob. Bob then parks the call at the Park

Server by sending a REFER to the Park Server. The server sends an INVITE to Alice which replaces the session between Alice and Bob.

The

Park Server utilizes the automaton, rendering, and byeless feature tags in F9 to indicate its capabilities to Alice. The call is accepted by Alice and causes Alice to send a BYE to Bob. Bob receives

notification of the successful park, and also receives the dialog identifiers in the application/sip body of the NOTIFY response.

Carol wishes to retrieve the call, so she sends an INVITE containing

the dialog identifiers to Alice which replaces the session with the Park Server. Alice accepts the call and sends a BYE to the Park Server. Carol obtains the dialog identifiers from a NOTIFY from the

Park Server.

Note that this call flow is a special case of call transfer.

Note also that this flow could also be used for Music on Hold.

## 2.16. Call Pickup

Alice

Bob

Bill

Bob and Bill are part of a work group at example.com that can pick up each other's calls. Alice calls Bob who does not answer. Bill wishes to pick up the call and sends a SUBSCRIBE to Bob to retrieve the dialog information. Bill then generates an INVITE with a Replaces to Alice. Alice answers the INVITE and sends a CANCEL to stop Bob's phone ringing. Note that the relative order of the 487/ACK sequence (F11/F12) and the 200 OK to the CANCEL (F10) is not deterministic.

This call flow shows the use of the "early-only" parameter [RFC3891]

in the Replaces header field of F7. This parameter prevents Alice from accepting the INVITE if Bob has already accepted the INVITE.

If

Bill had wished to "take" the call from Bob regardless of whether he had answered, the parameter would not have been present in F7.

Also note that the subscription between Bob and Carol could have been established prior to Alice's call.

Bob is initially busy when Alice calls. Alice subscribes to Bob's call state using a SUBSCRIBE F4. Bob sends a NOTIFY F8 when Bob is available. Alice is alerted, then Alice sends an INVITE to Bob to establish the session. The subscription is terminated using SUBSCRIBE F16.

## 2.18. Click to Dial

In this example, while browsing the web on his PC, Bob clicks on Carol's SIP URI intending to establish a session with Carol. Bob's web browser passes the SIP URI to the SIP client on Bob's PC. The PC client is configured with the URI of Bob's SIP phone. A REFER is sent to the SIP phone which results in the establishment of the session between Bob and Carol.

Note that Bob's PC requests that no REFER dialog be established by the use of the Refer-Sub: false header field [RFC4488].

This flow is preferable to the 3pcc flow because the end-to-end SIP signaling is not interrupted by the 3pcc controller, and because Bob's experience of the call will not be marred by the lack of ringback tone or possible clipping. Suitable authorization of the REFER and explicit authorization of the triggered INVITE by Bob is necessary.

### 3. Security Considerations

Since many of the examples in this document involve SIP call control, either peer-to-peer or 3pcc, the security considerations in the Multiparty Framework document [I-D.ietf-sipping-cc-framework] apply.

Many of the services shown in this document rely on a particular user

agent being part of a group. Members of a group could be, for example, employees within a particular department, a set of home phone extensions, members of a call center, etc. As such, user agents which are part of the group permit other group members special

privileges and features. For example, while a user agent may not in

general allow another user agent to learn detailed dialog information, this information might be shared with another group member in order to facilitate a service such as call pickup. Group members must be authenticated using normal SIP means such as certificates or shared secrets.

Johnston, et al.

SIP Service Examples

July

The service examples in this document make extensive use of the SIP call control primitives REFER, Replaces, Join, and the dialog package. The security considerations associated with each of these extensions [RFC3515], [RFC3891], [RFC3911], [RFC4235] apply to the scenarios in this document.

### 4. IANA Considerations

None.

### 5. Acknowledgements

The authors would like to thank the following reviewers of the document for their detailed comments and corrections: Vijay

Gurbani,

John Elwell, Joel Repiquet, Nagesh Kumar, Chandra Ravipati, Eric Burger, Jeroen Bemmel, Miguel Garcia, and Dale Worley.

The Transfer – Instant Messaging call flow is based on the "IM-a-call" call flow by Jonathan Rosenberg and Henning Schulzrinne. The Automatic Call Back call flow is based on a call flow by Adam Roach.

The authors wish to thank the following individuals for their assistance and review of this call flows document: Joel Repiquet, Aki

Aki Neimi, Rohan Mahy, Jonathan Rosenberg, Hemant Agrawal, Henry Sinnreich, Dean Willis, David Devanatham, Joe Pizzimenti, Matt Cannon, John Hearty, the whole MCI WorldCom IPOP Design team, Scott Orton, Greg Osterhout, Pat Sollee, Doug Weisenberg, Danny Mistry, Steve McKinnon, and Denise Ingram, Denise Caballero, Tom Redman, Ilya Slain, Pat Sollee, John Truetken, and others from MCI WorldCom, 3Com, Cisco, Lucent and Nortel.

SIP Call Control - Framework  
draft-ietf-sip-cc-framework-00

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC2026.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at  
<http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at  
<http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 11, 2002.

Copyright Notice

Copyright (C) The Internet Society (2001). All Rights Reserved.

Abstract

This document proposes that SIP call control features be added in a modular fashion, using an open-ended framework of extensions instead of a single extension. This memo proposes a modular design philosophy for call control extensions, and lists current work-in-progress call control related drafts.

Internet-Draft                    SIP Call Control – Framework                      July  
2001

## 1. Introduction

Most conventional telephony applications provide some level of support for modifying an in-progress call, or call control. Simple examples include call transfer and three way calling. More complex examples include conferencing and third party control.

The baseline SIP protocol[1] provides some limited support for call control, in that a call-leg participant can terminate the call leg, put it on hold, or modify the characteristics of its media stream.

However, many common call control applications require extensions to SIP in order to accomplish tasks such as referring a call to a new end point, or joining an existing call.

This memo proposes a modular approach to call control extension.

## 2. Changes from Previous Version

This revision has only minor changes from the previous version:

Removed open item concerning usage of the term "attended transfer."

Renamed file to reflect status as a SIP working group item.

Added references to the Call Control Model draft. [3]

in Added a section listing Call Control drafts that are currently process.

Removed discussion of original SIP call control draft.

Made minor editorial revisions to improve clarity.

## 3. Call Control Feature Examples

The following examples are call features for which extensions are currently under development, or may require extensions in the near future. These are examples only, and should not be considered authoritative; a formal treatment of call control features and terminology can be found in [3].

Transfer with Consultation Hold – The transferring party establishes a session with the transfer target before completing the transfer (Currently proposed in [4]).

Attended transfer – the transferring party establishes a session with the target and mixes both sessions together so that all three

parties can participate, then disconnects leaving the transferee and transfer target with an active session.

Conference Bridge – Callers join a conference on a centralized bridge.

Fully meshed conference – Callers establish sessions with all other callers on the conference. Each client mixes media streams.

Call Park – Call participant transfers a call to a call park, then retrieves it at a later time.

Call Pick – A party picks up a call that was ringing at another station.

Call Monitoring – A call center supervisor joins an in-progress call for monitoring purposes.

These examples are not exhaustive; we expect that more call control feature requirements will be proposed as SIP usage matures.

Therefore it is not possible for this document to enumerate all call control extensions in advance.

#### 4. A Modular Approach

We propose the SIP call control extensions be handled in a modular fashion. Instead of having a single unified call control extension, we should instead have a framework of extensions. Each of these extensions would focus on a bounded and coherent requirement (or extension) set.

A framework approach allows SIP entities to negotiate feature support with more granularity. For example, an implementation could assert that it supports call transfer without implying that it also supports conferencing.

#### 5. Call Control Extension Design Philosophy

Each call control extension should address a coherent group of requirements that are most likely to be needed as a set. If implementers find themselves having to add features that would not normally be required by their application just because they are defined by the extension, it is probably too big.

The negotiated support of one call control extension MUST not imply

the support of other extensions. While multiple extensions MAY share extended methods or headers, they MUST NOT do so unless the semantics are identical for all extensions.

Internet-Draft  
2001

SIP Call Control - Framework

July

Call Control extension designers SHOULD NOT overload existing methods and headers, unless the new function is actually a logical extension of the method or header in question.

Overloaded headers and extension create complications for protocol implementations. For example, if an extension overloads INVITE by adding a new header, the implementation must check every INVITE for the presence of the header before taking action.

If the implementation supports many extensions that each overload

INVITE, the decision logic becomes complex.

Subject to the limitation on overloading methods and headers, extensions should be as simple as possible and reuse existing SIP related features whenever appropriate.

## 6. Extension Negotiation

Since call control actions could conceivably be initiated by any user agent, SIP entities MUST follow the guidelines concerning feature negotiation described in the draft, "Guidelines for the Authors of SIP Extensions" [2].

If a SIP entity receives a message containing a call control extension method or header that normally requires negotiation but has not been properly negotiated, it SHOULD behave as if it had no knowledge of the extension in question, regardless of whether the entity is capable of supporting it.

It is tempting to suggest that if an entity recognized an un-negotiated extension, it should go ahead and act on it. However, it is dangerous for an entity to assume it understands the intent behind an extension without explicit negotiation. If two extensions were to use the same keyword for an extended

feature with different semantics, the receiving entity would have no way to guess the intent of the sending entity.

## 7. Adding New Call Control Operations

Additional call control operations SHOULD be implemented as additional SIP extension methods. Each such extension method MUST progress through the standards process as per other IETF standards.

Such extensions SHOULD include motivations, requirements, specification of syntax and semantics, and detailed usage examples. Additionally, it SHOULD describe how to specifically apply the negotiation guidelines in [2].

## 8. Call Control Documents

Work is in progress on the following documents which fit into this framework:

"SIP Call Control - Model" [3]

"SIP Call Control - Transfer" [4]

## 9. Security Considerations

Each call control extension SHOULD describe mechanisms to prevent unauthorized parties to invoke the extensions. Any extension that allows entities not party to a call to invoke call control operations MUST describe said mechanisms.

## 10. Acknowledgments

The author thanks the following for their contribution to this work:

## SIP Telephony Service Examples With Call Flows

### STATUS OF THIS MEMO

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC2026 [1].

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as work in progress.

The list of current Internet-Drafts can be accessed at  
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at  
<http://www.ietf.org/shadow.html>

### Abstract

This is an informational draft showing one implementation of a set of traditional telephony services using the Session Initiation Protocol. Diagrams of the SIP conversations and the complete SIP messages are provided.

Sparks, et. al.

Service Examples

October 1999

## 1 Overview:

This document provides call flows detailing a SIP implementation of the following traditional telephony services:

Call Hold	Consultation Hold
Unattended Transfer	Attended Transfer
Unconditional Call Forwarding	Busy Call Forwarding
No Answer Call Forwarding	3-way Call
Single-Line Extension	Find-Me
Incoming Call Screening	Outgoing Call Screening

It is the hope of the authors that this document will be useful for SIP implementors, users, designers, and protocol researchers alike and will help further the goal of a standard SIP implementation for IP Telephony. It is envisioned that as changes to the standard and additional RFCs are added that this document will reflect those changes and represent the current state of a standard SIP IP

Telephony implementation.

These flows assume the functionality described in "SIP Telephony Call Flow Examples" [2], which explores basic behavior and PSTN internetworking. Some of the scenarios described herein make use of "SIP Call Control Services" [3].

These flows were prepared assuming a network of proxies, registrars, PSTN gateways, and other SIP servers that have a pre-established trust relationship with each other, secured through other means than

SIP. User agents wishing to use the services in this network are required to authenticate themselves with an edge proxy using SIP Digest. All communication between these user agents and the remaining network elements MUST occur through the edge proxy. To improve the clarity of this document, this authentication step is not explicitly shown in all flows.

These flows use SIP as defined by RFC2543 [4] with the following changes/extensions assumed throughout:

A Contact header is included with every INVITE and 200 OK.  
A Content-Length header is present in every message, set to zero  
if there is no message body.  
The final entry in a Route header is always the Contact information obtained from the INVITE or 200 OK messages.

Each call flow is presented with a textual description of the scenario, a message flow diagram showing the messages exchanged between separate network elements, and the detailed contents of each message shown in the diagram.

Internet Draft

Service Examples

October 1999

Legend for Message Flows:

Dashed lines represent SIP messages. Optional messages have their labels surrounded with parenthesis. The direction of the message is indicated with < or >.

Example:      Invite

----->

Media paths are denoted with alternating dashes and ms. Direction is indicated as above.

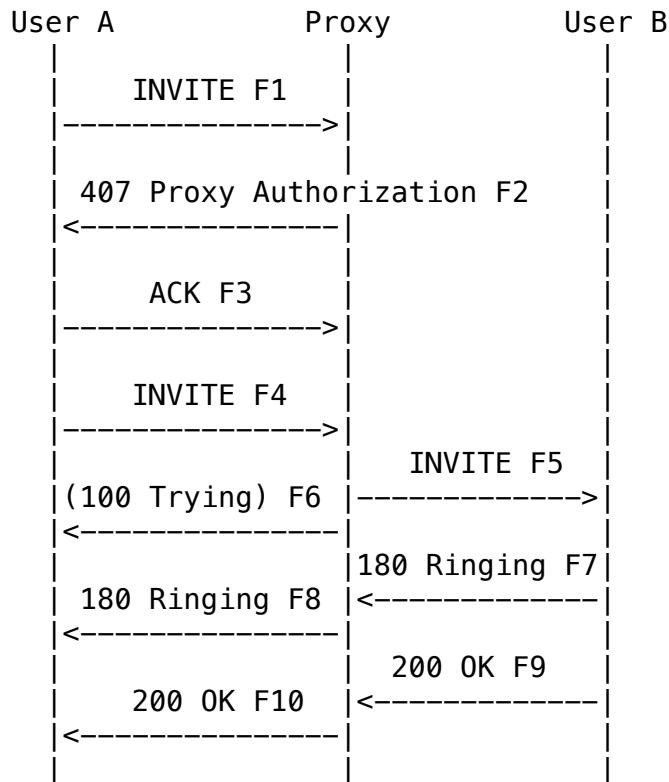

Example: Both way RTP established

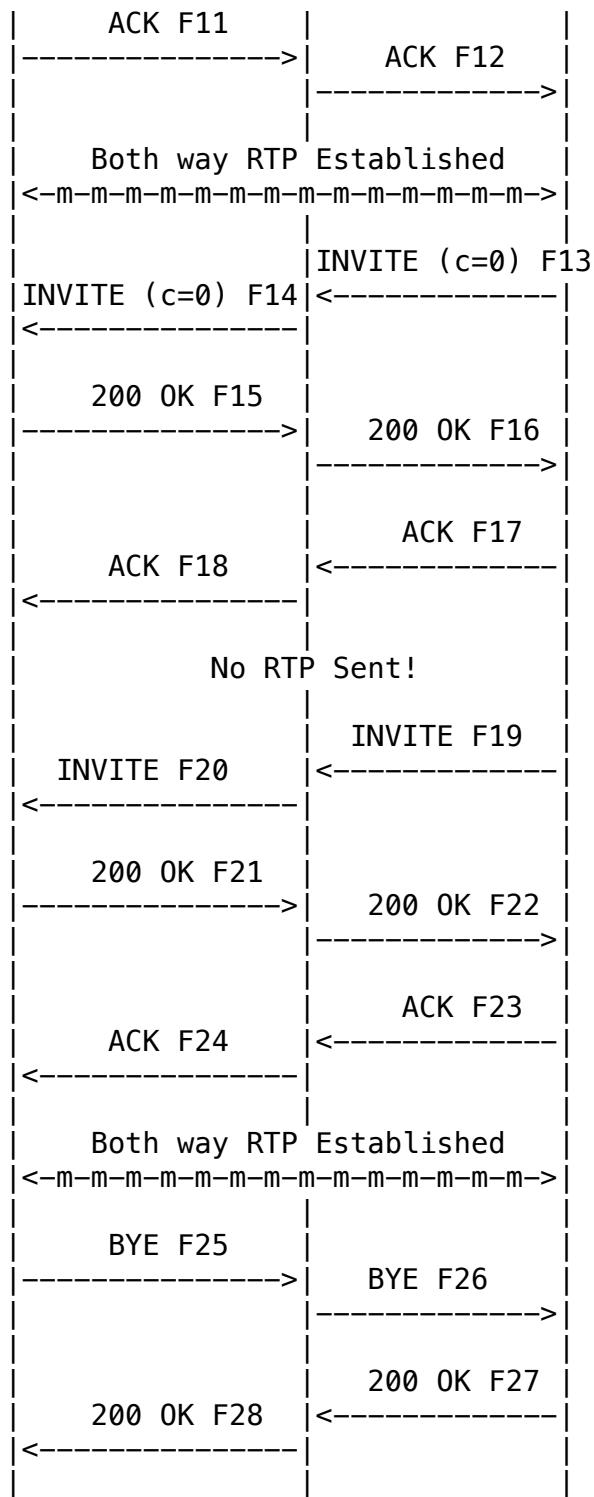

<-m-m-m-m-m-m-m-m-m-m-m-m-m-m-m->

## 2 Call Flows – IP Desktop Services Features

### 2.1 Call Hold

User A calls User B, User B places call on hold. User B then takes call off hold. User A hangs up call.

### 2.3 Unattended Transfer

User A call user B. User A then transfers User B to user C. User C then transfers User B to User D. User B hangs up the call.

## 2.4 Attended Transfer

User A calls user B. User A puts User B on hold, and Calls user C to announce transfer. User A terminates call with User C. User A transfers User B to User C. The call flow for this session would be a combination of Consultation Hold and Unattended Transfer.

## 2.5 Call Forwarding Unconditional

User B wants all calls forwarded to a Private Dialing Plan number 777-3660. (This information is known by the proxy). User A calls User B. The Proxy server rewrites the request URI, and forwards the INVITE to a gateway.

## 2.7 Call Forwarding ° No Answer

User B wants calls to B1 forwarded to B2 if B1 is not answered (information is known to the proxy server). User A calls B1 and no one answers. The proxy server then places the call to B2.

## 2.8 3-way Call

User A calls User B, User B then invites user C to a 3-way call. User B will mix the audio streams (act as the conference bridge). If user B drops out of the call then the entire call is dropped. This is not a fully meshed conference, and does not make use of the concepts in the call control draft.

The signaling for this scenario is as follows: User A calls User B, this establishes the call between A and B. User B calls User C, this establishes the call between B and C. User B will mix the audio streams, sending media originating at A to C, and media originating at C to A. There is no SIP signalling relationship between User A and User C.

## 2.9 Single Line Extension

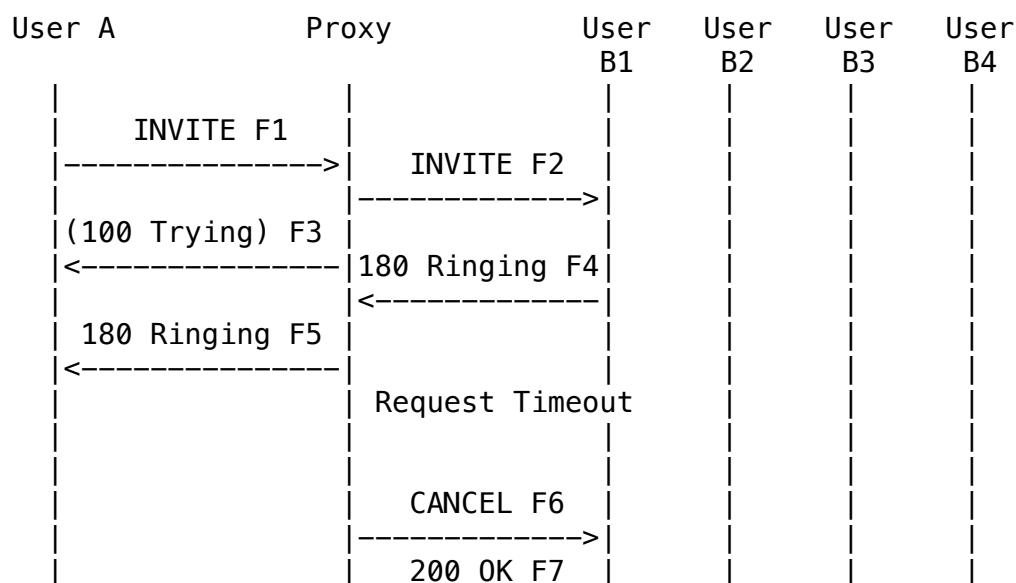

Single Line Extension (Sequential, First Wins implementation), a call will ring several extensions in sequence. The extension to

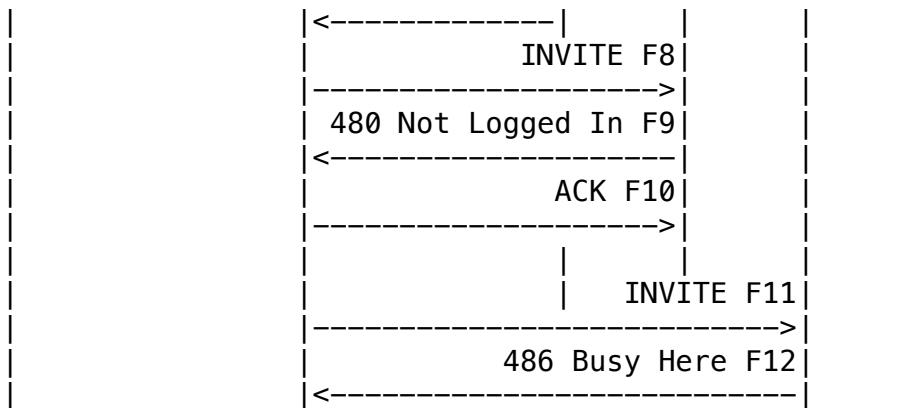

answer the call becomes the active set, no other sets may join the call. The signalling for this implementation of Single Line Extension and Find-Me is the same, the difference may be in the provisioning of the service.

## 2.10 Find-Me

A call to a user will attempt to locate that user by calling locations from a list of contacts. The location to answer the call becomes the active set, no other sets may join the call.

It is anticipated that the Find-me feature will be associated with individual users. The signalling for the implementation of Single Line Extension and Find-Me is the same, the difference may be in the provisioning of the service.
