RFP Q&Q IETF Website Revamp 2 Jul 14

Q12. Are you able to advise your budget for this project, or a range into which you expect this to fall?

A12. No.

Q13. Where will the new IETF website be hosted, and by whom? Are there any preferences or requirements relating to the underlying technology platform?

A13. We are hosting the websites on Dell servers running OpenSuse 12.3.
The web architecture includes Apache, MySQL, PHP, Python, Django. The
web servers host the IETF website along with community tools like the
Datatracker,
the Mail Archive, and the secretariat tools. Server configuration and software
changes
are possible if needed for the new site, but any such changes will have to be
compatible
with the existing tools. The website is served through the Cloudflare CDN, and
must be
served from the www.ietf.org subdomain.
